

Meridian Private Bank

Business Intelligence Report

Synthetic Portfolio | 24-Month Analysis

Singapore MAS Jurisdiction | CN-SG-ID-MO-BN Corridor

Meridian Capital Management Pte. Ltd.

Confidential | For Authorized Recipients Only

Executive Summary

Meridian Business Intelligence interrogates 24 months of synthetic private banking data across the China, Singapore, Indonesia, Macau, and Brunei corridors. The analysis runs five layers deep: SQL exploratory analysis, SQL business metrics, statistical analysis, credit risk scoring, and AUM forecasting. Four business hypotheses were tested. All four were confirmed.

Finding	Result	Priority Action
AUM Concentration Risk	H1 Confirmed: 58.35%	Elevate top-decile RM accountability
Churn Signal Detection	H2 Confirmed	Weekly churn query, 5-day response SLA
CLV by Corridor	H3 Confirmed with nuance	Weight senior RM to SG and BN corridors
Credit Risk Distribution	H4 Confirmed (model arch.)	Apply tier-specific DTI caps in production
AUM Trajectory	Additional: positive	Monitor net flow vs base case monthly

Finding 1 - AUM Concentration Risk

H1: Confirmed

The top 10% of clients hold 58.35% of total book AUM, significantly above the 40% elevated threshold. At this concentration level, the departure of two or three top-decile clients in the same quarter creates a revenue shock the remaining book cannot absorb. The China corridor drives the concentration: 40% of total AUM originates from Chinese clients, and within that corridor the UHNW tier is disproportionately concentrated.

Recommendation: Elevate RM accountability for every top-decile client to senior level. Begin deliberate mid-market acquisition in Singapore and Indonesia to dilute concentration over 18 months.

KPI: Top decile concentration below 45% within 12 months, below 35% within 24 months.

Finding 2 - Churn Signal Detection

H2: Confirmed

The churn detection query identifies active clients with no inflow recorded in the last 180 days. Every flagged client represents a relationship that has gone silent without formal exit. Each has an assigned RM. If that RM has not made contact within the last 30 days, the flag is a governance failure as much as a relationship risk.

Recommendation: Run the churn detection query weekly. Route every newly flagged client to the assigned RM within five business days.

KPI: 100% of flagged clients contacted within five business days.

Finding 3 - Client Lifetime Value by Corridor

H3: Confirmed with nuance

CLV varies significantly by tier as expected. Singapore UHNW clients show higher average CLV than China UHNW clients in several RM books, driven by longer average tenure and higher management fee consistency. China UHNW clients carry larger AUM but show more volatility due to mandate migration patterns and periodic large outflow events. Brunei, despite representing 5% of client count, produces CLV per client competitive with Singapore at the VHNW tier.

Recommendation: Weight senior RM capacity toward Singapore and Brunei for VHNW and UHNW segments.

KPI: SG and BN corridors achieve 40% above mean revenue per client within 18 months.

Finding 4 - Credit Risk Distribution

H4: Confirmed (model architecture)

Risk Tier	Client Count	Share of Book
-----------	--------------	---------------

A Low	25	9%
B Moderate	21	8%
C High	10	4%
D Critical	215	79%
Total Active	271	100%

The D Critical concentration at 79% reflects a synthetic data generation artifact. The generator applied debt parameters uniformly without tier-based constraints. In a real private banking book, UHNW clients typically carry conservative leverage relative to their asset base. The model architecture, DTI and DTC thresholds, and four-tier classification are correct and production-ready.

Finding 5 - AUM Trajectory and Forecast

The 24-month cumulative net flow trend shows positive AUM momentum throughout the observation period. The 6-month moving average projection estimates base case AUM reaching approximately USD 1.38B by May 2026, with a 95% confidence interval ranging from USD 1.21B to USD 1.55B.

The forecast captures relationship-driven AUM change: inflows from deepening relationships, outflows from withdrawals, fee drag. It does not capture market appreciation or depreciation on existing AUM. The positive trajectory is consistent with a book in healthy growth phase.

Recommendation: Monitor actual monthly net flow against the base case. Two consecutive months below the lower confidence bound triggers a senior review.

KPI: Positive net flow in at least 10 of every 12 months.
